Quality Process

To provide you with the best possible service, we are fully committed to ensuring the quality of the products we deliver, both in terms of the application itself and its development and maintainability.

To ensure the quality of such an application, and to avoid delivering a product that does not fully meet your vision, we will work in sprints. This will ensure that at the end of each sprint, you can confirm the application is heading in the right direction and anticipate any potential missteps.

We believe that a good application is one that is easy to maintain, so we will implement a set of practices for the teams whose main function will be to maintain the application once it is in production.

Our practices are as follows:

- Use of "best practices" (a set of development conventions that allow an application to maintain a coherent and simple structure).
- Implementation of unit tests to verify the correct functionality of the application's features.
- Implementation of end-to-end tests, which allow testing of the application's pages from a user's perspective.
- Establishment of continuous integration and continuous deployment, automating tests during application development and the construction of an environment conducive to the application's proper functioning.

To ensure that our tests cover the entirety of our code, we will implement code coverage.
